20 October 2010

Sleeping Giant Ni-Cu Intersected Updip at Ntaka Hill, Nachingwea Ni-Cu JV, Tanzania

IMX Resources Limited (ASX:IXR) is pleased to announce another wide nickel-copper intersection from the 2010 diamond drilling completed at the new Ntaka Hill Sleeping Giant Zone at the Nachingwea project in southern Tanzania. The project is a 25:75 Joint Venture between IMX Resources Limited ('IMX') and Continental Nickel Limited ('CNI').

New Sleeping Giant Intersection:-

- **73.35m at 0.50% Ni, and 0.11% Cu including two higher grade intervals of 15.9m at 1.22% Ni, 0.21% Cu and 12.55m at 0.60% Ni, and 0.15% Cu in hole NAD10-216**

Drilled to test for an eastern updip extension to the previously reported NAD10-211 intersection of 53.1m at 0.74% Ni, and 0.15% Cu from 318m (ASX 23 September 2010), NAD10-216 successfully intersected the Sleeping Giant Mineralisation from 171m down hole. This hole confirms the south plunging, west dipping zone shallows to the east and remains open in all directions.

Based on these encouraging initial drill results, the current drilling program is being expanded to allow for the completion of up to seven additional drill holes totalling approximately 1,800 metres. This drilling will test for extensions of the zone close to surface, up-plunge to the north and up-dip to the east from the area of current drilling. The drilling is expected to begin in late October and, if successful, a Mineral Resource Estimate Study of the Sleeping Giant Zone will be considered after all assays are received and validated.

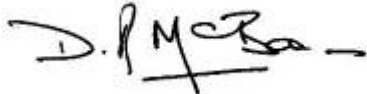

An RC drilling program to test priority targets developed from an ongoing regional exploration program is currently underway.

A full discussion of new results for Sleeping Giant including a drill hole location plan can be viewed in the CNI release to the TSXV attached below.

Nachingwea Holding Structure

The IMX interest in the Nachingwea project are held indirectly through a 37.2% interest in Continental Nickel, which holds a 75% interest in the Tanzanian JV company, Ngwena Limited. Ngwena is the licence holder for the Nachingwea tenements. IMX Resources also holds a 25% direct interest in the project through a 25% interest in Ngwena.

Continental Nickel has recently completed its expenditure of Cdn\$15m to earn an additional 5% of the joint venture, reducing IMX's joint venture interest to 25%. IMX will now contribute pro rata to the joint venture.

About IMX Resources Limited

IMX Resources Limited (ASX:IXR) – is headquartered in Perth, Western Australia, is listed on the Australian Stock Exchange (ASX) with a current market capitalisation of approximately \$120m.

IMX is an active diversified mining company with projects in South Australia, Tasmania, Tanzania and Mozambique, East Africa, focusing on a range of commodities including iron-ore, nickel, gold, copper, platinum and uranium.

The company is disciplined in following a careful strategy to maximise shareholder value by discovering and developing ore bodies. IMX achieves this by participating in multiple, quality exploration projects in joint ventures with global mining companies, and by listing spin-off companies, to ensure programs with high potential are well-funded, while retaining a significant interest to provide exposure for IMX shareholders.

Subject to the successful completion of the terms of the Sichuan Taifeng HOA, IMX will own 51% of the Cairn Hill project, 55 kilometres south-east of Coober Pedy, South Australia. This unique magnetite Fe – Cu – Au project is close to the Darwin to Adelaide railway line. Phase 1, which has recently commenced mining, is a DSO magnetite project. Testwork indicates that the ore produces a premium coarse grained magnetite product, with a clean saleable Cu / Au concentrate. IMX has a Phase 1 life of mine sales offtake agreement with Jilin Tonghua Iron & Steel (Group) Mining Co Ltd for the DSO magnetite production. Beyond Phase 1, preliminary metallurgical testwork has been completed on Phase 2 of the project targeted at producing a premium grade magnetite concentrate.

IMX owns 100% of the iron ore rights on the Mt Woods tenements where besides the potential of Phase 3 magnetic anomalies outside ML6303, recent drilling has intersected magnetite to the south and west of Cairn Hill with target mineralisation of 320-550mt @ 25-35% Fe based on the drilling, ground gravity and aeromagnetics.

The immediate upside for Cairn Hill / Mt Woods remains the definition of further resources to support a long term 3-5mtpa iron ore operation.

IMX has recently formed a Joint Venture with OZ Minerals for the non-iron ore rights on its Mt Woods tenements. OZ Minerals will have 51% of the joint venture and must spend \$20m over 5 years to retain this interest. OZ Minerals is targeting Prominent Hill style copper / gold mineralisation.

In Tanzania, IMX holds 100% of the Mibango nickel / copper / platinum project.

IMX spun off 70% of the Nachingwea Nickel - Copper project in Tanzania into a Continental Nickel Limited (TSXV:CNI) in August 2007. IMX currently holds 37.2% of Continental Nickel and retains a 25% interest in the Nachingwea Nickel - Copper project through a joint venture company structure.

IMX owns 26.7% of Uranex (ASX:UNX), a spin-off company from IMX, which listed on the ASX in October 2005 and is dedicated uranium company with assets in Australia and Tanzania.

Press Release

Continental Nickel Continues to Intersect Sulphides at the “Sleeping Giant” Zone, Including 1.22% Nickel and 0.21% Copper over 15.9 Metres; Nachingwea Drilling Program Expanded

Toronto, Ontario (October 19, 2010): Continental Nickel Limited (TSXV: CNI) (“Continental” or “CNI” or the “Company”) is pleased to announce that it continues to intersect wide zones of nickel-copper sulphide mineralization at the new “Sleeping Giant” Zone at Ntaka Hill on the Nachingwea nickel-copper sulphide project (“Nachingwea”) in Tanzania. Diamond drill hole NAD10-216 intersected several zones of disseminated, stringer and net textured sulphides including higher grade intervals of 0.60% nickel and 0.15% copper over 12.55 metres and 1.22% nickel and 0.21% copper over 15.9 metres, from within a wider interval of 73.35 metres grading 0.50% nickel and 0.11% copper. The project is a 75:25 Joint Venture between CNI and IMX Resources Limited (“IMX”) of Australia.

The Company is currently implementing a \$4 million exploration program at Nachingwea. In the current program, thirty-six diamond drill holes have been completed, thirty-five totalling 4,722.7 metres at Ntaka Hill and one drill hole of 266.1 metres at the Lionja target, 8 kilometres to the south. Assay results have now been reported for twenty-one of the thirty-six drill holes, totalling 2,988.5 metres, including the results of the one drill hole totalling 329.1 metres reported herein. The assay results are provided below as Table I; a location figure may be viewed using the link provided with this release.

The primary objective of the Ntaka Hill drilling program is to evaluate selected sulphide deposits for extensions of mineralization beyond the currently defined Mineral Resources and to test prioritized targets for new sulphide zones. Currently, NI 43-101 compliant Measured and Indicated Mineral Resources, from six separate sulphide deposits (G, H, J, L, M and NAD013) at Ntaka Hill, total 3.1 million tonnes grading 1.31% nickel and 0.24% copper at a US\$23/tonne Net Smelter Return (“NSR”) cut-off (Press Release July 15, 2009).

NAD10-216 (Sleeping Giant)

Drill hole NAD10-216 was drilled to a depth of 329.1 metres and was positioned 120 metres to the east and up dip of drill hole NAD10-211. NAD10-211 intersected a 53.1 metre interval of disseminated, stringer and net textured sulphide mineralization at the Sleeping Giant zone, grading 0.74% nickel and 0.15% copper, including a higher grade interval near the base of the zone, grading 1.07% nickel and 0.19% copper over 19.0 metres (Press Release September 22, 2010). NAD10-216 intersected several intervals of disseminated to net-textured sulphide mineralization starting at 171 metres down hole and extending to 280.8 metres. The assay intervals include an upper interval grading 0.32% nickel and 0.07% copper over 31.0 metres and a lower interval grading 0.50% nickel and 0.11% copper over 73.35 metres. The lower interval includes higher grade intervals of 0.60% nickel and 0.15% copper over 12.55 metres and 0.89% nickel and 0.16% copper over 26.8 metres. The latter interval includes 15.9 metres grading 1.22% nickel and 0.21% copper near the base of the lower mineralized zone.

Nachingwea Drilling Program Expanded

The drilling completed to date has outlined a thick, south plunging, and west dipping zone of mostly disseminated nickel-copper sulphide mineralization which is open in all directions. Based on these encouraging initial drill results, the current drilling program is being expanded to allow for the completion of up to seven additional drill holes totalling approximately 1,800 metres. This drilling will test for extensions of the zone close to surface, up-plunge to the north and up-dip to the east from the area of current drilling.

The drilling program is expected to begin in late October and, if successful, a Mineral Resource Estimate Study of the Sleeping Giant Zone will be considered after all assays are received and validated.

Meanwhile, a reverse circulation drilling program has begun which is testing priority targets developed from the ongoing regional exploration program.

Craig MacDougall, President & CEO of Continental Nickel Limited, said “The newly discovered Sleeping Giant nickel sulphide zone continues to grow and the initial results suggest potential to outline a large, moderate grade, sulphide zone, still open in all directions. The expansion of the current drilling program is important to evaluate the potential of the Sleeping Giant zone, and, if successful, may lead to the first estimation of Mineral Resources for this new discovery.”

Qualified Persons

The quality control, technical information and all aspects of the exploration program are supervised by Patricia Tirschmann, P. Geo., Vice President, Exploration for CNI. The information in this release was prepared under the direction of Craig MacDougall, P. Geo., President and CEO for Continental Nickel Limited. Both Ms. Tirschmann and Mr. MacDougall are qualified persons as defined by National Instrument 43-101.

Quality Control

The drilling was completed by Tandrill Limited of Tanzania. Drill core samples (NQ) are cut in half by a diamond saw on site. Half of the core is retained for reference purposes. Samples are generally 1.0 metre intervals or less at the discretion of the site geologists. Sample preparation is completed at the ALS Chemex preparation lab in Mwanza, Tanzania. Sample pulps are sent by courier to ALS Chemex analytical laboratory in Vancouver, Canada. Blank samples and commercially prepared and certified Ni sulphide analytical control standards with a range of grades are inserted in every batch of 20 samples or a minimum of one per sample batch. Analyses for Ni, Cu and Co are completed using a peroxide fusion preparation and ICP-AES finish (Analytical Code ME-ICP81). Analyses for Pt, Pd, and Au are by fire assay with an ICP-AES finish (Analytical Code PGM-ICP23).

About Continental Nickel

Continental Nickel Limited is focused on the exploration, discovery and development of nickel sulphide deposits in geologically prospective, but under-explored regions globally. The Company's key asset is its 75% interest in the Nachingwea project in Tanzania, where NI 43-101 Mineral Resources have defined 40,000 tonnes of contained nickel, and ongoing exploration is underway to evaluate the potential to expand these Resources.

The Company also has an option joint venture on the St. Stephen project in New Brunswick, Canada where it has discovered new Ni-Cu sulphide zones from its recently completed 2010 diamond drill program.

Continental Nickel Limited has 38,943,664 shares issued and outstanding (46,211,514 on a fully-diluted basis) and trades on the TSX Venture Exchange under the symbol CNI. The Company remains well-funded with over C\$10.8 million in the treasury.
